A *unique* potato storage building service

Putting up a potato store is known to be a farmer's nightmare. That's because he has to think about all the components of the store - planning, quotations, construction, insulation, refrigeration, ventilation and control - and all the suppliers of these components have to be co-ordinated to

get the job done. The result is often hassle, delay, wasted time, inefficiency and mismatched components.

But now there is a complete one-stop-shop for new or upgraded potato storage installations

ARM POTATO STORAGE SYSTEMS

ARM and its partner companies Proctor Group and Redwood Refrigeration can now deliver a complete building package taking a new building from groundwork to full operation in one design and installation package. All you have to do is approve the design and specification and then its over to ARM to do the rest.

This is why the ARM Potato storage package works

- All work is planned and supervised by the same team
- Each component of the storage system is designed to complement the rest
- Quality is the key word for each component -
**Quality design,
Quality buildings,
Quality refrigeration,
Quality control.**
- ARM sell you a storage system, not a basket of unrelated components

Specification and Planning

Our team has years of experience in the planning of agricultural buildings and will produce a quotation and specification for the whole potato store system. We have modern computer aided design facilities and we produce a complete specification quickly and comprehensively. We can also help in planning negotiation issues and the provision of a site electricity supply.

Site work and construction

ARM work anywhere in the UK and bring in a team of expert site management staff who co-ordinate the whole job according to a tight programme of works - so you know exactly what to expect at each stage. Because the whole installation is under the control of one company, undue delays are avoided and the time from base work to completion is minimised.

Insulation

All potato stores need to be well insulated and our composite insulation panels are top quality units which exceed British standard specification for use in potato stores. Internal surfaces are smooth, tough and hygienic. Accurate installation ensures the whole building envelope is sealed effectively.

Refrigeration

Our 'Redwood' refrigeration units are the most efficient and carefully engineered in the business. They are designed to provide optimum environmental conditions at lowest cost and employ advance components to give reliable efficient operation in all conditions.

Controls

Advanced control is one of the most important features of the ARM package, and is one thing that puts our installation head and shoulders above the rest. Not only do our controls provide accurate temperature control through high resolution multiple sensors, they sense deep into the refrigeration system controlling and logging its operation. This means that our engineers can download information on the operation of the refrigeration and store, and carry out diagnostics if there is a fault. What's more, by installing a telephone line connection to the controller, the refrigeration system can be monitored and controlled remotely. So a unit can often be fixed without an engineer coming out to site - a real cost saving.
